

SECTION 1

The Window

78% of contractors are testing AI; fewer than 2% have deployed it at scale. The window to build a proprietary intelligence layer is two to three years. After that, the data moat tilts toward whoever moved first.

SECTION 2

Market Size

Metric	2026	2029	CAGR
Construction-tech AI market (US)	\$4.0B	\$12.0B	24%
LV / Six Peak addressable (LA multifamily GC)	\$80M	\$150M	23%
GCs deploying AI at scale (est.)	<2%	15-20%	—
GCs testing AI	78%	95%	—

SECTION 3

Five-Phase Adoption Timeline

2024-2025

Phase 1 • Experimentation
Point tools for individual tasks. LV is here today.

2026-2027

Phase 2 • Platform Assembly
First-mover GCs build integrated platforms. Mission Control lands here.

2028-2029

Phase 3 • Data-Moat Lock-In
Early platforms accumulate data; late movers start three years behind.

2030-2031

Phase 4 • Industry Split
AI-native GCs take disproportionate share of complex projects.

2032+

Phase 5 • Consolidation
AI-first GCs acquire or displace slow-moving competitors.

SECTION 4

Data-Moat Thesis

The plan puts 41 projects on the platform — 11 in-place plus 30 BD deals over the rollout. At peak, the concurrent projects feed daily field data into the system, training the AI on LV's specific subcontractor network, cost patterns, local permit dynamics, and building types.

Algorithms can be copied. Data can't. Off-the-shelf AI gives generic answers; Mission Control gives LV-specific answers no competitor can replicate without dozens of their own LA multifamily projects.

SECTION 5

Three Scenarios & The Cost of Delay

Scenario	Action	Outcome (FY2033)
Do nothing	Keep manual coordination	\$19.4M cum NI; no uplift, no platform equity
Start late (FY2029)	Build after 2 years of manual BD	\$19.4M + ~\$3M late uplift; 3 years behind
Start now (this plan)	Sprint 1 alongside first BD signing	\$19.4M + ~\$8.7M = ~\$28M; proprietary moat + exit optionality

A two-year delay is estimated to cost **\$40–75M in enterprise value** through lost margin expansion, slower scaling, and the disadvantage of facing rivals who have already built their data moats. The pipeline happens either way — the question is whether LV captures the margin uplift or lets it leak to subs, change orders, and back-office drag.

Market-size and cost-of-delay figures are directional strategic estimates, not pro forma outputs.
