

SECTION 1

The Plan Foundation

The model rests on two layers of contracted work. The Base Case comprises 11 in-place projects totaling \$238M. The Extended BD plan adds 30 deals totaling \$480M (21 at \$15M, 9 at \$18M), signed on a roughly bimonthly cadence, with construction starts spanning 2027 through early 2033.

Together they represent approximately **\$718M of contracted volume across 41 projects**. On this baseline the analysis layers the incremental impact of Mission Control.

SECTION 2

FY2026–2033 Pro Forma

The pro forma below is taken directly from the Annual Summary of the updated model. All figures in \$ millions; fiscal year ends June 30.

Schedule 1 — Consolidated pro forma summary (\$ in millions, by fiscal year; FY ends June 30)

Line	FY26	FY27	FY28	FY29	FY30	FY31	FY32	FY33
Construction billing	58.8	87.4	66.0	88.0	99.3	95.9	96.5	73.8
Gross profit	6.5	9.2	9.5	10.5	11.9	11.6	11.6	8.7
LV (GC) net income	2.3	1.9	2.1	3.6	4.9	4.4	4.4	1.5
Six Peak net income	(1.0)	(0.6)	(0.8)	(1.0)	(1.0)	(0.9)	(0.8)	0.4
Consolidated net income	1.3	1.3	1.3	2.6	3.9	3.5	3.6	1.9
Cumulative consolidated NI	1.3	2.6	3.9	6.5	10.4	13.9	17.5	19.4

Source: Annual Summary, updated pro forma (Base Case in-place + LV BD extended). Recalculated May 2026.

Horizon note.

Cumulative consolidated net income is the running total of LV (GC) net income plus Six Peak net income from the Annual Summary of the updated pro forma (Base Case in-place + LV BD extended). The FY2026–33 figure of \$19.4M is the cumulative peak; including the FY2034 wind-down (a – \$3.2M year, as projects complete while overhead continues) brings the full-horizon total to \$16.3M.

SECTION 3

Mission Control Uplift Components

Mission Control's incremental value is evaluated against the contracted baseline through two primary mechanisms, supported by two secondary effects.

Component	Incremental NI
Margin expansion — ~150 bps on \$480M of BD volume via cost control, reduced rework, and faster variance detection	~\$7.2M
Deferred next-wave hiring — ~\$300K/yr deferred as the platform absorbs coordination load	~\$1.5M
Total illustrative uplift	~\$8.7M

Secondary effects (not separately quantified): faster draw assembly improves working-capital timing and financing cost, and better documentation reduces change-order disputes and litigation exposure.

Applied to the \$19.4M baseline, the ~\$8.7M uplift takes cumulative consolidated NI to approximately **\$28M**.

SECTION 4

Sensitivity Analysis

Four scenarios bracket the outcome by BD closure rate and Mission Control adoption. The baseline pipeline funds the platform even in the bear case.

Scenario	BD deals close	MC margin lift	Cumulative NI
Downside	40%, delayed start	+50 bps	\$7–9M
Bear	60% of pipeline	+75 bps	\$10–13M
Base (this plan)	100% as planned	+150 bps	\$19.4M base / ~\$28M w/ uplift
Bull	120% (added deals)	+200 bps	\$32–38M

The base column reflects the recalculated pro forma; bear, bull, and downside ranges are directional management scenarios.

SECTION 5

Investment & Payback

Mission Control's total investment is approximately \$5.0M over Years 1–2, covering the AI team, technology, infrastructure, and operating runway.

Line item	Amount
AI team total comp (Yr 1–2)	\$2.8M
Technology & infrastructure	\$0.6M
Data pipeline & tooling	\$0.4M
Operating runway (Yr 1–2)	\$1.5M
Total Mission Control buildout	\$5.0M

~\$5.0M

TOTAL INVESTMENT

~\$8.7M

ILLUSTRATIVE UPLIFT

~24 mo.

PAYBACK PERIOD

Payback runs roughly 24 months from full deployment, before any value assigned to the proprietary data moat. On a cumulative-NI basis, ~\$28M of cumulative NI on ~\$5.0M invested represents a multiple of roughly 5x over the plan horizon.
